Influencer credibility and brand trust in short-video commerce

Abstract. We tested the model with an online survey of 412 Vietnamese shoppers.

Drawing on the S-O-R framework, we expect influencer credibility to raise brand trust.

H1: Influencer credibility positively affects brand trust.

H2: Brand trust positively affects purchase intention.

H3: Influencer credibility positively affects purchase intention.

Method. Data were collected through an online survey in March-April 2024. Respondents were recruited via social media groups of online shoppers. The final sample comprised 412 respondents after attention checks. We analysed the data with PLS-SEM in SmartPLS 4. Harman's single-factor test showed no dominant factor.

Table 1. Measurement model

Construct	Items	Alpha	CR	AVE
Influencer Credibility	5	0.89	0.91	0.67
Brand Trust	4	0.86	0.90	0.70
Purchase Intention	3	0.84	0.88	0.71

Table 2. Correlations (square root of AVE on the diagonal), N = 412

	1	2	3
1. Influencer Credibility	0.82		
2. Brand Trust	0.48	0.84	
3. Purchase Intention	0.39	0.52	0.84

Table 3. Structural model results

Hypothesis	Path	beta	t	Result
H1	Influencer Credibility -> Brand Trust	0.42***	8.40	Supported
H2	Brand Trust -> Purchase Intention	0.35***	6.10	Supported
H3	Influencer Credibility -> Purchase Intention	0.08	1.21	Not supported

Note: *** p < .001.

Discussion. We extend the S-O-R framework to short-video commerce.
Brands should disclose sponsorships early in the video.
The cross-sectional design limits causal claims.
Future studies could use longitudinal data.
